Vanta is hiring this role to make Recruiting and People work move faster without allowing one-off automations to become fragile infrastructure. That is the problem I would be excited to help solve: turn manual friction and teamgenerated ideas into durable workflows with a clear source of truth, the right mechanism, retained human authority, a visible failure path, an accountable owner, and evidence that the workflow is actually helping.

My current work at Vape-Jet is hands-on AI-first operating transformation across production, quality, purchasing, support, customer success, engineering issue flow, ERP, Jira, HubSpot, Slack, telemetry, standard work, training, and accountability. Through DudeWorth, I develop AI-readiness and agentic workflow patterns that connect structured context, retrieval, human judgment, escalation, evaluation, governance, adoption burden, and time-to-value. Earlier roles at Amazon and Compunetics built the launch discipline, quality systems, root-cause practice, and crossfunctional operating cadence required to keep fast-moving systems reliable.

I would bring that mechanism-building approach into Vanta's Recruiting and People teams. Ashby should remain a primary automation surface for hiring workflows; Dust and Claude should extend the team's context and build capacity; scripts, integrations, and standard automation should handle deterministic work; and sensitive People decisions should retain explicit human authority. The goal is not maximum AI. It is less manual work, cleaner handoffs, better candidate and employee experience, observable reliability, and workflows the team can confidently maintain.

I created an independent candidate vision at <https://russelldudek.github.io/Vanta/>. It includes a People Automation Warranty, a representative decision studio, the first-90-days plan, and the measures I would use to distinguish a promising demo from an adopted operating mechanism. It is a hypothesis for discussion, not a claim about undisclosed Vanta processes.

I would welcome the opportunity to discuss where Recruiting currently feels the greatest mismatch between speed and consistency, which automations already earn trust, and what evidence would make the team comfortable spreading a pattern across pods.

Carpe diem,
